

1) Capture an IP packet on Wireshark, what is the value of each of the header fields. Explain why the value is what it is.

Internet Protocol Version 4 (IPv4)

- **Version: 4**
 - This indicates that the packet is using IPv4.
- **Header Length: 20 bytes (0101)**
 - The length of the header is (5 * 4) 20 bytes .
- **Differentiated Services Field: 0x00 (DSCP: CS0, Not-ECT)**
 - Default DSCP value, indicating best-effort service.
- **Total Length: 203**
 - The total length of the IP packet, including header and data, is 203 bytes.
- **Identification: 0x5b64 (23396)**
 - Unique identifier for the packet used in reassembly of fragmented packets.
- **Flags: 0x0 (Don't fragment)**
 - Indicates fragmentation control. 0x0 means no fragmentation.
- **Fragment Offset: 0**
 - The position of the fragment in the original packet. 0 indicates it's not fragmented.
- **Time to Live (TTL): 1**
 - The packet can only make 1 more hop before being discarded. Often set low for multicast packets.
- **Protocol: UDP (17)**

- The encapsulated protocol is UDP.
- **Header Checksum:** 0xabd8 (validation disabled)
 - Used for error-checking the header.
- **Source Address:** 192.168.1.67
 - The IP address of the device sending the packet.
- **Destination Address:** 239.255.255.250
 - The IP address of the device receiving the packet.

2) On Leetcode, find a problem that can be solved with Dijkstra's Algorithm.

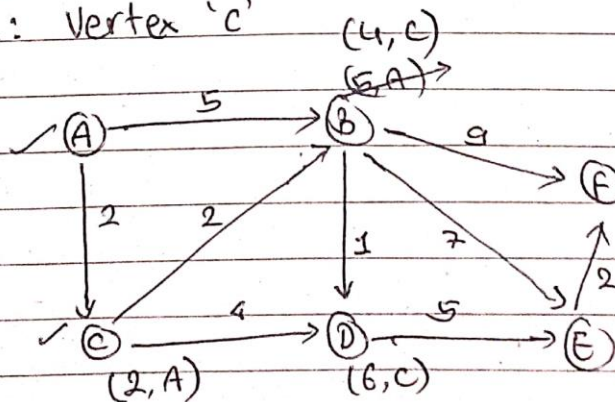

(#) Dijkstra Algorithm:
(Shortest path betⁿ vertex (A) & (F))

Step 1: Let's start with vertex 'A'.

Step 2: Vertex 'C'

Step 3: Vertex 'B'

Step 4: Vertex 'D'

Step 5: Vertex 'E'

Hence, the shortest path from vertex A to F is;
(A → C → B → D → E → F)
Length : 12

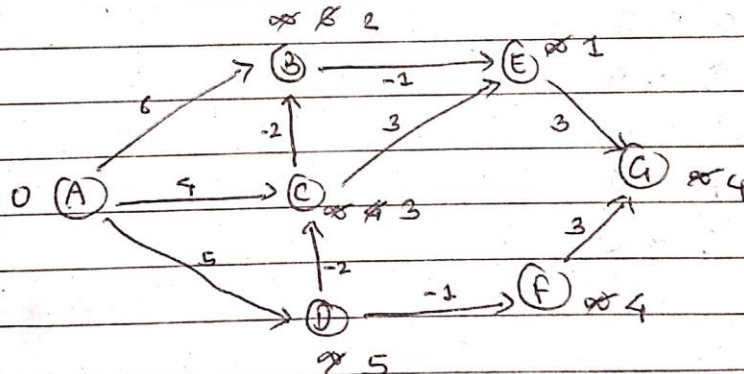

- 3) On Leetcode, find a problem that can be solved with Bellman-Ford Algorithm and solve it.

Bellman-Ford Algorithm

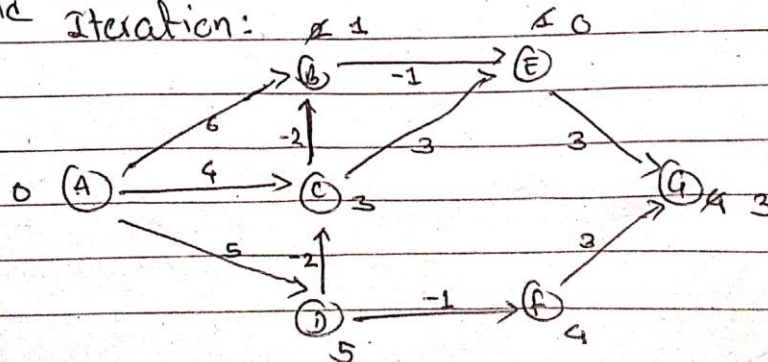

Edges List: (A,B), (A,C), (A,D), (C,B), (D,C),
(B,E), (C,E), (D,F), (E,G), (F,G)

1st Iteration:

2nd Iteration:

3rd Iteration:

Shortest path:

A - 0

B - 1

C - 3

D - 5

E - 0

F - 4

G - 3
